De aanpak

We zijn begonnen met het kijken welke actors we allemaal hadden. Uiteindelijk hebben we er 3 gevonden, deze zijn: end users, developers en een productowner. Deze actors zijn allemaal een aparte thread. Daarna zijn we de verschillende activiteiten gaan onderscheiden. Deze hebben we vertaald in semaphores. Elke thread heeft in principe een oneindige levenscyclus aangezien ze allemaal een `while(true)` loop hebben.

Communicatie

De threads communiceren met semaphores en twee counters. De twee counters zijn hoeveel ontwikkelaars er aan het wachten zijn en hoeveel eindgebruikers een probleem hebben. Het veranderen van deze counters zijn ook weer beschermd met semaphores, zodat niet twee threads tegelijk een counter kunnen aanpassen.

Test

We hebben onze oplossing getest door elke keer als er een actie gebeurd (overleggen, werken, reizen) dit in de console uit te printen. Hieraan kan je zien dat elke actor(thread) elke keer wel weer aan de beurt komt. Zo kan je ook zien dat een thread niet ergens op vastloopt (een deadlock krijgt) aangezien hij dus elke keer terugkomt in de console.

In bijlage A kan je de output van ons programma vinden als het programma normaal functioneert. Oftewel als er een product owner is, er programmeurs zijn en er eindgebruikers zijn.

Een test zonder users resulteert in dat er alleen overleg tussen drie programmeurs en de product owner komt. Dit is te zien in de output van ons programma in bijlage B.

We hebben getest zonder een productowner dus er zijn alleen programmeurs aan het werk. Hierdoor komen er geen meetings en staan de users te wachten totdat iemand het probleem van de user aanspreekt. De output is te vinden in bijlage C.
